

Sale Name: Chairs Limited Business Closure Auction - Owner Retiring
LOT 69 - Foucault Pendulum

Description

This is a Foucault pendulum, a device designed to demonstrate the Earth's rotation. It consists of a pendulum suspended from a fixed point that swings back and forth in a steady plane while the Earth rotates beneath it. The setup includes a metal bob attached to a string, which is affixed to a frame with adjustable legs. The pendulum swings over a circular tray filled with fine sand, allowing it to mark the pattern created by the Earth's rotation. The frame appears to be made of metal and wood components, providing both stability and a classic aesthetic.

Quantity: 1
